

Hospital Stay for a Complete Hepato-Biliary-Pancreatic Checkup

- 👉 This program screens for hepato-biliary-pancreatic diseases that are hard to detect during routine health checkups.
- 👉 This program is recommended for those concerned about pancreatic cancer, those with diabetes, and those who don't drink alcohol but have been told their liver function is slightly impaired.

Liver

Metabolic dysfunction-associated steatohepatitis (MASH), a condition associated with lifestyle-related diseases, is gaining attention.

Pancreatic cancer, biliary tract cancer

These cancers are hard to detect during routine health checkups. It is said that people with diabetes or pancreatic cysts are more prone to pancreatic cancer.

**3-day,
2-night
hospital stay**

Receive results as well as treatment and follow-up suggestions.

1. Blood test results (Liver, gallbladder and biliary tract, pancreas)

Liver fibrosis (checking for liver cirrhosis)

Tumor markers associated with pancreatic cancer and biliary tract cancer

2. Abdominal ultrasound (Liver, gallbladder and biliary tract, pancreas)

Liver stiffness measurement (FibroScan)

3. Contrast-enhanced CT scan, MRI scan

(Liver, gallbladder and biliary tract, pancreas)

Check for liver cancer and pancreatobiliary cancer

4. Endoscopic ultrasound (gallbladder and biliary tract, pancreas) (optional)

Detailed examination for microscopic lesions or pancreatic cysts with endoscopic ultrasound

5. Nutritional guidance (Liver)

Educate you about food that prevents disease

6. Advice from our specialists

Our specialists explain the necessity of future treatment and plans for future follow-up, and refer you to other specialists such as surgeons and metabolic medicine specialists if necessary.
